CFO & KCC Dashboard Documentation and Findings

Introduction

This document explains the final design decisions, findings, KPI logic, and business reasoning behind both the CFO and KCC dashboards developed for the Carleon Accounts Receivable case. The dashboards were redesigned and improved after several feedback sessions in order to better align with the different operational and strategic needs of the stakeholders.

The dashboards focus on improving visibility into overdue receivables, customer payment behaviour, collections prioritization, and financial monitoring.

The project eventually evolved into two separated dashboard perspectives:

- CFO Dashboard → Strategic financial monitoring
- KCC Dashboard → Operational collections and follow-up management

This separation became important because both departments require different levels of detail and different types of insights.

CFO Dashboard

Purpose of the CFO Dashboard

The purpose of the CFO dashboard is to provide strategic insight into the company's receivables performance and overdue financial exposure.

The dashboard was designed to support high-level financial monitoring and decision making rather than daily operational collections work.

The main business questions addressed by the dashboard are:

- How much money is currently overdue?

- Are receivables performance trends improving or worsening over time?
- Are customers paying slower over time?
- Is the overdue problem caused by payment behaviour or business volume?
- What level of financial exposure currently exists?

The dashboard therefore focuses on:

- strategic KPIs
- financial trends
- liquidity risk
- receivables efficiency
- executive-level monitoring

CFO Dashboard Changes and Improvements

1. Replacement of the “Average Payment Time by Month” Visual

Original Situation

Initially, the dashboard contained a visual called “Average Payment Time by Month”. This visual mainly showed monthly fluctuations in payment timing.

Although the visual technically displayed payment information, it did not clearly connect payment behaviour to the actual overdue receivables problem.

The monthly granularity also created several problems:

- too many fluctuations
- inconsistent trends
- difficult executive interpretation
- limited strategic value

The visual became more operational than strategic.

Improvement

The original graph was replaced with a new visual called:

“Overdue Amount vs DSO Trend”

This visual combines:

- Total Overdue Amount (columns)
- DSO Corrected (line)

Why This Was Improved

The new visual better supports executive-level analysis because it combines:

- financial exposure
- receivables efficiency

The visual allows the CFO to understand whether increasing overdue balances are caused by:

- higher business volume
- slower customer payment behaviour

Example:

- Rising overdue balances + stable DSO → likely business volume growth
- Rising overdue balances + rising DSO → collections/payment behaviour issue

This created a much more strategic and financially meaningful dashboard visual.

2. DSO Logic Rebuild

Original Problem

The earlier DSO-related calculations were closer to average payment timing calculations rather than a true financial DSO KPI.

The earlier approach focused mainly on:

- invoice payment timing
- operational averages

instead of strategic receivables efficiency.

New DSO Calculation

A corrected DSO calculation was introduced using:

- open receivables
- sales values
- invoice-level transaction filtering

The implemented formula:

DSO = (Open Receivables / Sales) × 365

The calculation used:

- InvoiceDate
- InvoiceNumber
- MatchID
- TransactionType
- Type

from the BankTransactions table.

Purpose

The new DSO calculation better reflects:

- receivables efficiency
- cash collection performance
- liquidity performance

The KPI became more aligned with financial reporting and executive monitoring.

3. Quarter-Based Analysis

Original Situation

The earlier dashboard relied heavily on monthly trend analysis.

This created:

- visual noise
- inconsistent fluctuations
- difficult interpretation

Improvement

The DSO analysis was moved toward quarterly trend analysis instead of monthly reporting.

Why

Quarter-based analysis:

- reduces noise
- improves readability
- simplifies trend interpretation
- supports executive reporting better

Quarterly analysis aligns more closely with how CFOs normally monitor financial performance.

4. Standardization of Financial Measures

Original Problem

Some measures were calculated from different source tables, causing:

- inconsistent values
- filter mismatches
- unreliable KPI comparison

Improvement

The following measures were rebuilt using the same financial transaction source table:

- Total Overdue Amount
- Total Outstanding Amount

Both measures were rebuilt using:

- gbkmut

Result

This improved:

- consistency
- comparability
- KPI reliability
- trustworthiness of the dashboard

5. Outstanding vs Overdue Finding

During the dashboard redesign, an important analytical finding was discovered:

Total Outstanding Amount and Total Overdue Amount returned almost identical values.

This suggests that most currently open receivables in the dataset are already overdue.

Possible explanations include:

- most invoices genuinely being overdue
- dataset containing mostly overdue open balances
- historical unresolved receivables

- extraction logic already excluding non-overdue invoices

This became an important business validation point that should eventually be confirmed with the client.

6. Strategic Separation from KCC Dashboard

The CFO dashboard was intentionally simplified to remove operational collections details.

Operational elements such as:

- customer prioritization
- collections worklists
- detailed follow-up information

were removed from the CFO dashboard and moved into the KCC dashboard.

This improved the strategic focus of the CFO dashboard.

Final CFO Dashboard KPIs

The final CFO dashboard includes:

- Total Overdue Amount
- DSO Corrected
- Average Overdue Days
- Total Outstanding Amount
- Overdue Amount Trend
- Overdue Amount vs DSO Trend

These KPIs support:

- executive financial monitoring
- receivables performance analysis

- liquidity risk assessment
- strategic collections oversight

KCC Dashboard

Purpose of the KCC Dashboard

The KCC dashboard was designed for operational collections management.

Unlike the CFO dashboard, the KCC dashboard focuses on:

- customer follow-up
- collections prioritization
- overdue severity
- operational workload
- urgency management

The main business questions addressed are:

- Which customers require immediate follow-up?
- Which accounts are most overdue?
- Which customers should be prioritized first?
- Which customers create the highest collections workload?
- How severe are the overdue receivables?

The dashboard therefore became:

- action-oriented
- operational
- collections-focused

KCC Dashboard Changes and Improvements

1. Overdue Logic Rebuild

Original Problem

Initially, overdue calculations used:

DueDate + 30 days

before an invoice was considered overdue.

This delayed overdue classification artificially.

Improvement

The overdue logic was corrected to:

DueDate < TODAY()

This means invoices become overdue immediately after the due date passes.

Why

This aligns better with realistic collections operations and financial overdue definitions.

2. Operational KPI Development

Several operational KPI measures were introduced.

Total Overdue Amount

Purpose:

- measure overdue financial exposure
- identify financially important overdue customers

Max Days Overdue

Purpose:

- identify severely overdue customers
- support urgency classification
- highlight escalation risks

Overdue Invoice Count

Purpose:

- identify operational collections workload
- measure recurring overdue behaviour
- support collections prioritization

3. Introduction of Priority Score

Original Problem

Initially, prioritization was effectively based mostly on overdue days.

This created unrealistic situations where:

- very old but financially insignificant invoices ranked too highly

Improvement

A combined Priority Score was introduced using:

- overdue amount
- overdue days
- overdue invoice count

The final logic balanced:

- financial impact
- lateness severity
- operational workload

Purpose

The Priority Score helps KCC focus on:

- the most financially important overdue customers
- customers requiring urgent follow-up
- customers creating the highest collections workload

4. Top 10 Customers Requiring Follow-Up Visual

Visual Type

Horizontal bar chart.

Purpose

The visual ranks customers by Priority Score.

This allows KCC to:

- identify high-priority customers quickly
- focus collections resources
- improve operational efficiency

Horizontal bar charts were chosen because they work well for:

- rankings
- prioritization
- operational comparisons

5. Operational Collections Table

The operational table was redesigned to function as a collections worklist.

The final table includes:

- customer/account ID
- Total Overdue Amount
- Max Days Overdue
- Overdue Invoice Count
- Priority Score

Purpose

The table supports:

- collections follow-up
- workload management
- operational prioritization
- collections escalation

The table became one of the most operationally useful elements of the dashboard.

6. Conditional Formatting

Conditional formatting was applied to:

- Max Days Overdue

Purpose

This improves:

- urgency visibility
- scanning speed
- operational usability

Severely overdue accounts are highlighted visually, helping KCC quickly identify high-risk cases.

7. Overdue Severity Categories

Original Problem

Initial overdue groups were unrealistic and extremely large:

- 400–499 days
- 500–999 days
- 1000+ days

Improvement

Operational overdue categories were introduced.

Examples included:

- 1–30 days
- 31–90 days

- 91–365 days
- 365+ days

Purpose

The smaller groupings improved:

- collections segmentation
- ageing analysis
- operational filtering
- urgency classification

This directly addressed client feedback requesting smaller overdue ranges.

8. Ageing Bucket Analysis

A clustered column chart was introduced using:

- Overdue Severity
- Total Overdue Amount

Purpose

The chart visualizes how overdue balances are distributed across overdue severity groups.

This supports:

- collections monitoring
- severity analysis
- operational workload understanding

Important Finding

The visual revealed that most overdue balances fall into extremely old overdue categories.

This suggests the dataset contains:

- historical unresolved balances
- legacy receivables
- possible data quality issues
- long-standing overdue accounts

This became an important analytical finding within the project.

9. Separation Between CFO and KCC Dashboards

The final dashboard solution clearly separated:

CFO Dashboard

Focus:

- strategic monitoring
- liquidity trends
- financial KPIs
- executive reporting

KCC Dashboard

Focus:

- operational collections
- customer prioritization
- overdue severity
- follow-up actions

This separation improved:

- dashboard clarity
- stakeholder alignment
- usability

- business relevance

Final Findings and Conclusions

The final dashboard solution evolved significantly through multiple feedback sessions and iterative redesign.

The project ultimately achieved:

- clearer stakeholder separation
- improved KPI logic
- more realistic operational prioritization
- stronger strategic financial monitoring
- improved dashboard usability
- more consistent financial calculations

The CFO dashboard became focused on:

- strategic financial exposure
- receivables efficiency
- executive trend monitoring

while the KCC dashboard became focused on:

- collections operations
- urgency management
- customer prioritization
- follow-up efficiency

Several important data findings were also discovered during development, including:

- extremely old overdue receivables
- historical unresolved balances
- missing DSO records for certain years
- almost identical overdue and outstanding balances

These findings demonstrated the importance of:

- data validation
- business logic consistency

- stakeholder-specific dashboard design
- separating operational and strategic reporting needs

Overall, the dashboards evolved from general financial reporting into a more business-oriented decision-support solution aligned with the specific needs of both management and collections operations.
